Ethernet Hub Service allows domestic and international carriers to reach more customers by extending their market coverage across the XO nationwide network, all with a single connection. This innovative service not only provides access to our expansive fiber footprint, but also plugs you directly into our nationwide off-fiber access options, which broaden your reach to nearly 4 million buildings and as many as 10 million businesses across the US.

Expand Your Sales Footprint

Increase your selling territory by leveraging our award-winning Ethernet over Copper coverage.

Reduce Expenditures

Access our nationwide network and avoid the expense of your own network build.

Simplified Configuration

Serve hundreds of users through a single interconnection with XO Ethernet Hub Service.

Eliminate Protocol Conversions

Remove the need for conversions between European and US telecommunications standards, such as E1/T1.

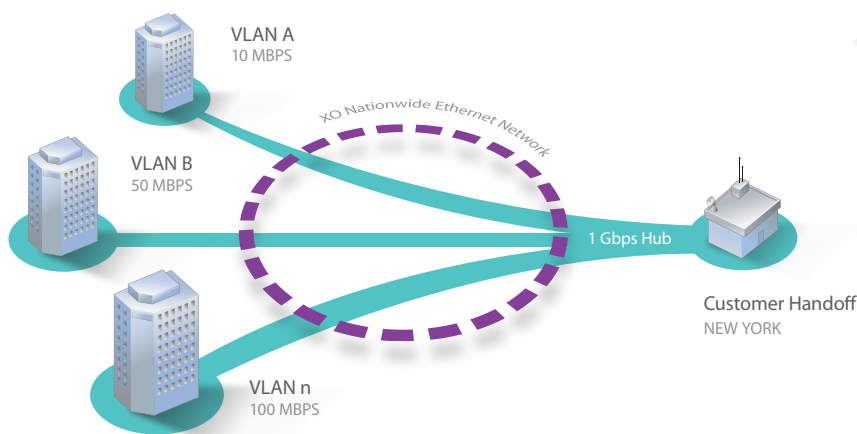

More Bandwidth Options

Take advantage of a wide variety of access options, ranging from 3Mbps up to 10Gbps, via rate-limited end links.

Eliminate protocol conversions

Utilize VLAN stacking to apply traffic segmentation and quality settings, while ensuring efficiency by preventing VLAN tag conflicts.

How Ethernet Hub Service Works

Once you've specified the location in which the hub connection is to be delivered, XO will provide the centralized hand-off. XO will then work with you to determine sites for tail connections and begin processing your order. You may assign VLAN Tags in order to separate your traffic by either application or group. XO then stacks its own VLAN Tag and carries your traffic across our network in real-time. By using our Dedicated Bandwidth technology, the hub is never oversubscribed, as all traffic is real-time, meaning class of service control rests completely in your hands.
